

Osnove privrednog rasta

PROF. DR MAJA BAĆOVIĆ

16.10.2023.

Fenomen privrednog rasta

- Dinamika BDP-a u stalnim cijenama
- Teorija rasta: kako je moguće ostvariti održivi privredni rast tokom dugog vremenskog perioda
- Faktori proizvodnje:
 - Rad
 - Fizički kapital (oprema)
 - Zemlja i ostali proizvodni faktori
- Rast produktivnosti rada i kapitala – tehnički progres (akumulacija znanja i usavršavanje tehnika)

Gross domestic product, annual real growth rates (based on Eurostat data)

Proizvodna funkcija

- Da li proizvodimo više zato jer koristimo veću količinu proizvodnih inputa ili su inputi postali produktivniji? Ili je riječ o kombinaciji?
- Proizvodna funkcija:
 - K - fond (stok) kapitala (fabrike, oprema, zemlja, putna infrastruktura, telekomunikaciona infrastruktura, itd)
 - L - ukupni broj radnih časova ($L=Nh$, N-broj radnika, h-broj radnih časova po radniku)

$$Y = f(K, L)$$

- Output će rasti sa rastom K i L

Production Function (Extensive Form)

Kob-Daglasova proizvodna funkcija

$$Y = K^\alpha L^{1-\alpha}$$

- α – elastičnost outputa u odnosu na kapital: rast kapitala za 1% izazvaće rast outputa za vrijednost α
- konstantni prinosi na obim proizvodnje
- Marginalna produktivnost kapitala je opadajuća funkcija po K, rastuća po L

$$\frac{\partial Y}{\partial K} = \alpha K^{\alpha-1} L^{1-\alpha} = \alpha \left(\frac{L}{K}\right)^{1-\alpha}$$

- Marginalna produktivnost rada je rastuća funkcija po K, opadajuća po L

$$\frac{\partial Y}{\partial L} = (1 - \alpha) \left(\frac{K}{L}\right)^\alpha$$

- $\frac{Y}{L}$ - Output po radnom času (produktivnost rada)

$$\frac{Y}{L} = y = \frac{K^\alpha L^{1-\alpha}}{L} = K^\alpha L^{-\alpha} = \left(\frac{K}{L}\right)^\alpha = k^\alpha$$

Marginalna (granična produktivnost)

- Kako će output reagovati na malu promjenu jednog inputa dok se ostali inputi ne mijenjaju?

$$\frac{\Delta Y}{\Delta K}$$

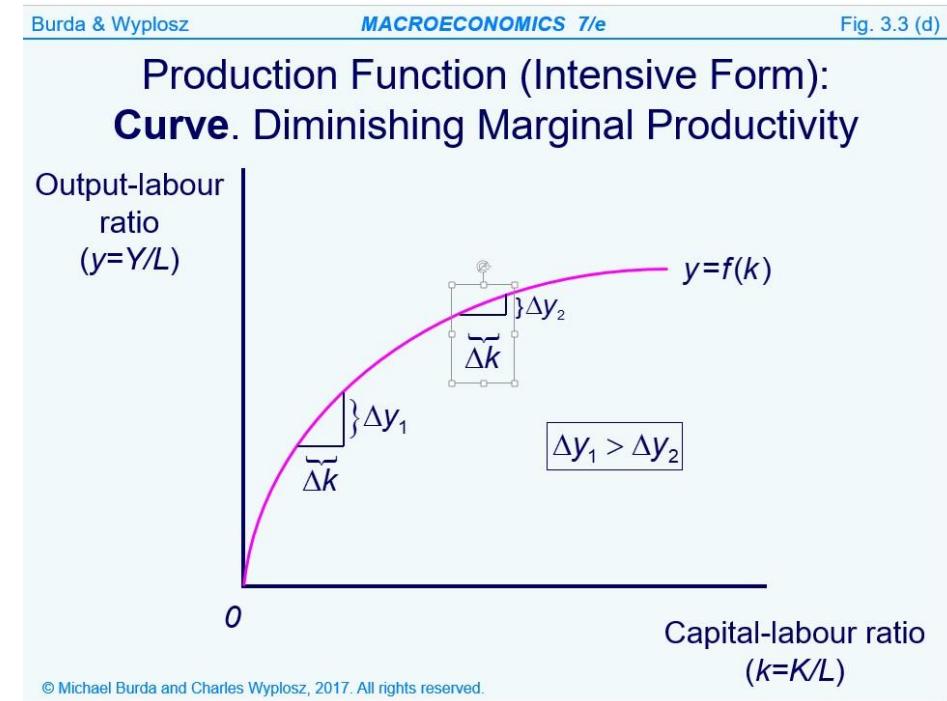

- Opadajuća marginalna produktivnost – konstantno dodavanje jedinice inputa neće imati isti efekat na output neograničeno. Ukoliko se vrijednost ostalih inputa ne promijeni, rast outputa će se vremenom smanjivati

Pretpostavke o prinosima

- Konstantni prinosi: output se mijenja srazmjerno promjeni inputa
- Rastući prinosi: output se mijenja brže od promjene inputa
- Opadajući prinosi: output se mijenja sporije od promjene inputa
- Uz pretpostavku konstantnih prinosa, proizvodnu funkciju možemo da prikažemo kao:

$$y = f(k)$$

- y – output po radnom času (prosječna produktivnost rada)
- k – kapital po radnom času (kapitalna intenzivnost)

Ocijenjena proizvodna funkcija – 30 evropskih zemalja

Agregatna proizvodnja je funkcija stoka kapitala, zaposlenih i TFP:

$$LY_t = c + \alpha LK_t + \beta LL_{o,t} + \gamma LLL_{t,t} + \delta LR_t + \varepsilon_t$$

Sektor industrije:

$$LY_{t,i} = c + \alpha LK_t + \beta LL_{oi,t} + \gamma LLL_{ti,t} + \delta LR_t + \varepsilon_t,$$

Tehnološki intenzivne (pametne) usluge:

$$LY_{t,k} = c + \alpha LK_{k,t} + \beta LL_{k,t} + \delta LR_t + \varepsilon_t,$$

Ostale usluge:

$$LY_{to,i} = c + \alpha LK_{to} + \beta LL_{oo,t} + \gamma LLL_{to,t} + \delta LR_t + \varepsilon_t,$$

Akumulacija kapitala i privredni rast

- Da li je akumulacija kapitala beskonačan proces?
- Da li rast štednje neizostavno vodi bržem rastu? Ako je štednja po definiciji odložena potrošnja, što to ustvari znači?
- Izvori finansiranja investicija

$$I = S + (T - G) + (Z - X)$$

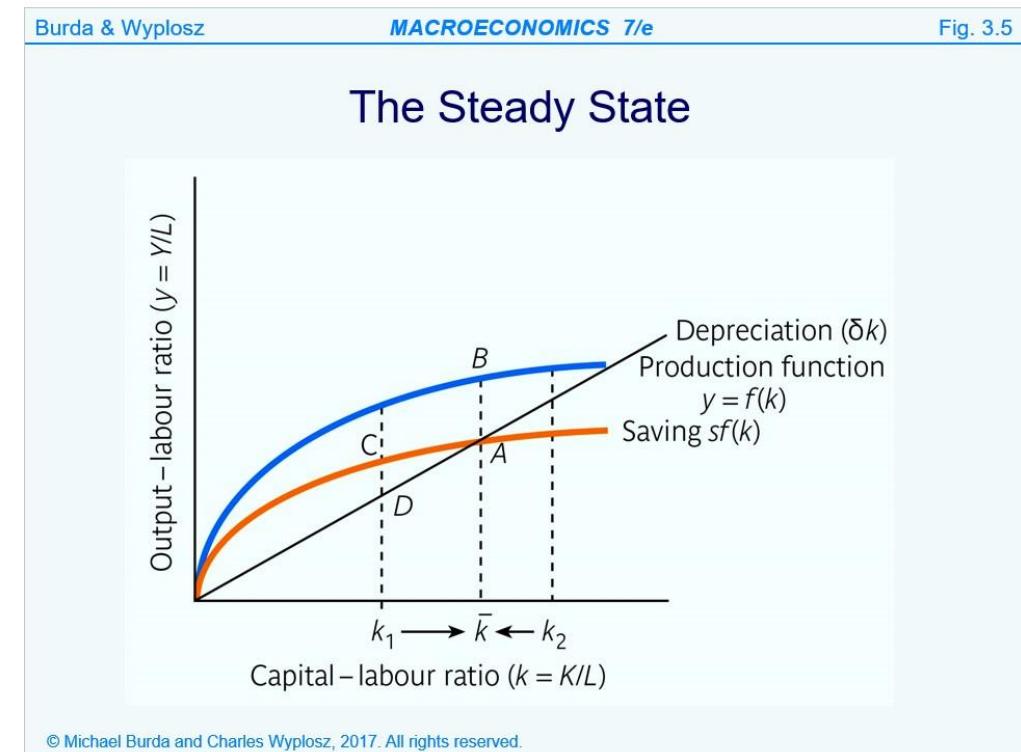

- S – domaća štednja, $(T - G)$ – budžetski saldo, $(Z - X)$ – aldo tekuceg racuna BP
- Ako je $(T - G) = 0$, i $(Z - X) = 0$, onda je

$$I = S$$

- Rast kapitala u potpunosti se finansira iz domaće štednje

$$I = sY$$

$$\frac{I}{L} = s \left(\frac{Y}{L} \right) = sy = sf(k)$$

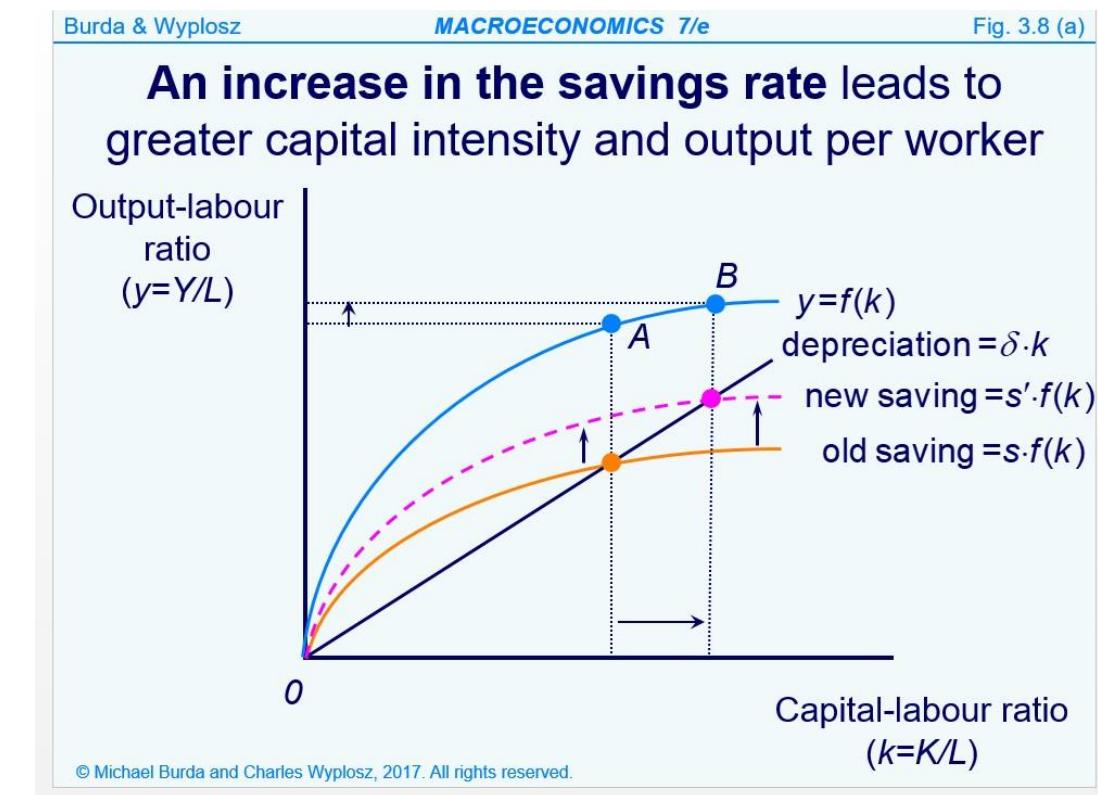

Akumulacija kapitala

- Promjena stoka kapitala posljedica je novih investicija i amortizacije

$$\Delta K = sY - \delta K$$

$$\Delta k = sy - \delta k$$

- Neto akumulacija kapitala po jedinici rada pozitivno zavisi od stope štednje a negativno od stope amortizacije
- Kapitalna intenzivnost (k) povećava output ali i amortizaciju

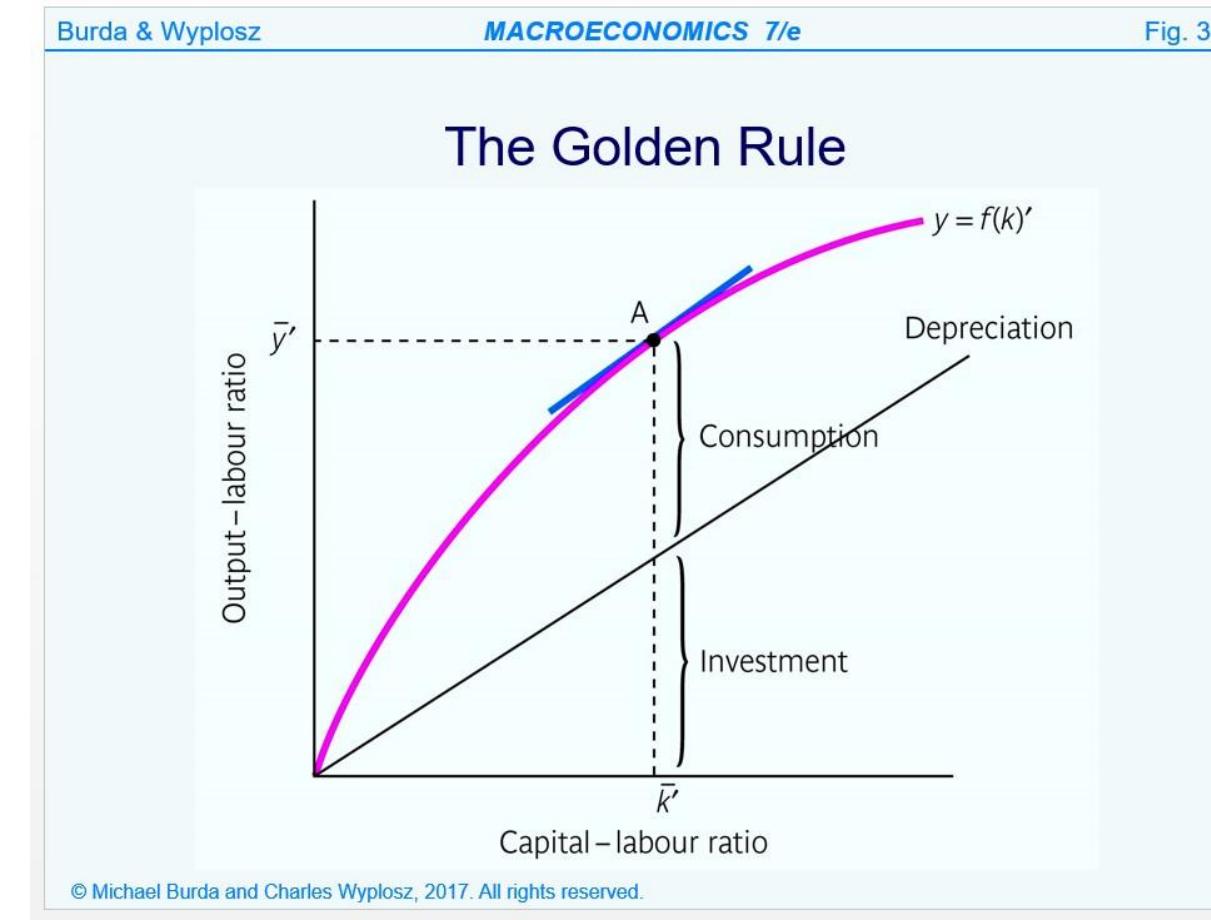

Zlatno pravilo

- U situaciji kada nemamo rast stanovništva ni tehnički progres, privreda maksimizira potrošnju u tački u kojoj marginalni dobitak od dodatne jedinice BDP koja je otišla u štednju i investicije bude jednak stopi amortizacije

$$MPK = \delta$$

- Uvođenje rasta stanovništva mijenja zlatno pravilo, kao i tehničkog progrusa
- Marginalna produktivnost kapitala jednaka je sumi stope amortizacije, rasta tehničkog progrusa i rasta stanovništva

$$MPK = \delta + a + n$$

Rast stanovništva i privredni rast

- Rast radne snage je izvor privrednog rasta
- Uticaj demografskih faktora (rast broja stanovnika)

$$\Delta k = sy - (\delta - n)k$$

- Proces širenja kapitala – kada K/L treba da poraste, investicije treba da obezbijede ne samo prirast kapitala koji će nadoknaditi amortizaciju, već i onaj dio koji će pratiti rast broja radnih sati (povecanje broja radnika)
- BDP per capita može da raste jedino onda kad BDP raste brže od rasta broja stanovnika

Tehnički progres i privredni rast

- Ukupna faktorska produktivnost (TFP)
- Rast znanja i napredak tehnologije vode rastu produktivnosti
- Proširena verzija proizvodne funkcije

$$Y = f(A, K, L)$$

- A (tehnologija) nije proizvodni faktor
- Ako pretpostavimo da djeluje direktno na rad:

$$Y = f(K, AL)$$

$$\Delta k = sf(k) - (\delta + a - n)k$$

Ukupna faktorska produktivnost

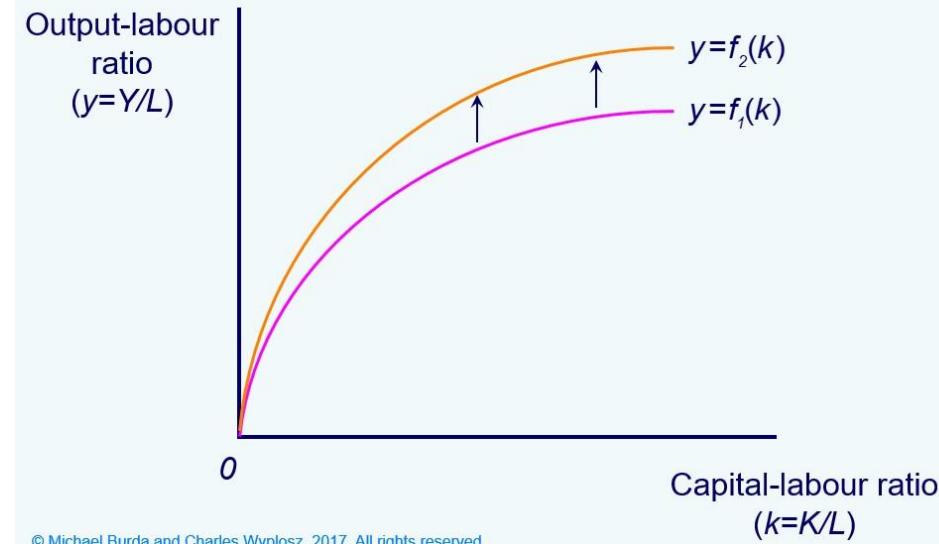

- Ukupna faktorska produktivnost (TFP) je dio outputa koji nije objašnjen količinom inputa korištenih u proizvodnji, a obično se mjeri Solowovim rezidualom (Solow, 1957).
- Nivo TFP je određen efikasnošću korišćenja inputa u procesu proizvodnje (Comin, 2010).
- Ukupna faktorska produktivnost je važna determinanta ekonomskih fluktuacija, ekonomskog rasta i razlika u dohotku po stanovniku među zemljama, što je potvrđeno mnogim empirijskim studijama. Baier, Dwyer i Tamura (2006), koristeći uzorak od 145 zemalja i podatke za više od sto godina za 23 zemlje u uzorku, primjenjujući metodologiju računovodstva ekonomskog rasta, pokazali su da ukupna faktorska produktivnost objašnjava 14% prosječnog rasta proizvodnje po radniku. Pod ukupnom faktorskom produktivnošću, oni podrazumijevaju: „promjene u tehnologiji, institucionalne promjene, i druge faktore“.
- Barro (1998) ističe da je tehnološki napredak u stvari ključan za dugoročni rast po glavi stanovnika koji je američka ekonomija nastojala održati već dva vijeka. Nelson (2000) je naglasio da: „Ranih 1950-ih, empirijski rad je jasno pokazao da „rast ukupne faktorske produktivnosti“ predstavlja lavovski udio izmjereno povećanja proizvodnje po radniku. Tehnološki napredak je predložen kao glavna sila koja stoji iza rasta TFP-a.“

Output-Labour Ratios (Y/L): Three Countries

Metodologija

- Procjena ukupne faktorske produktivnosti je važna zbog njenog doprinosa dugoročnom rastu dohotka po glavi stanovnika.
- Ekonometrijski i aritmetički pristup (koncept računovodstva rasta)
- Sa računske metodološke tačke gledišta, od rada Abramovitz-a (1956) i Solow-a (1957), pristup računovodstva rasta je primijenjen u značajnom broju studija.
- „Pristup računovodstva rasta pruža kompletan sistem dosjea, u smislu da sve pojave koje utiču na ekonomski rast moraju to učiniti kroz količine ulaznih faktora, relativne intenzitete faktora ili ukupni rast faktorske produktivnosti, bilo pojedinačno ili u kombinaciji. Drugo, rezultati računovodstvene vježbe mogu ukazati na područja u kojima će parametarske studije vjerovatno biti plodonosne”. (Norsworthy, 2005.)

Računovodstvo privrednog rasta

- Rezidual Soloua

$$\frac{\Delta A}{A} = \frac{\Delta Y}{Y} - \left[(1 - S_l) \frac{\Delta K}{K} + S_l \frac{\Delta L}{L} \right]$$

- S_l - udio rada, $(1-S_l)$ – udio kapitala

[Makro vjezbe](#)

TFP u zemljama Balkana

- Primjenjujući navedenu metodologiju, procijenili smo TFP za ukupnu ekonomiju i pojedinačne sektore u periodu 2000-2017. godina.
- Analizirane su sledeće ekonomije: Albanija, Bosna i Hercegovina, Bugarska, Sjeverna Makedonija, Crna Gora, Srbija i Rumunija
- Varijacije između stopa rasta proizvodnje, TFP-a i doprinosa kapitala i rada su uočene ne samo među zemljama, već i među sektorima u svakoj zemlji i vremenskom okviru. Od 2000. do 2017. godine, najveći rast TFP-a u ukupnoj privredi zabilježen je u Rumuniji, koja je druga vodeća zemlja po stopi rasta proizvodnje u uzorku, sa prosječnom stopom rasta proizvodnje od 4,13%. Najveća prosječna stopa rasta proizvodnje zabilježena je u Albaniji, iako je prosječni rast TFP bio niži u poređenju sa Bosnom i Hercegovinom, Srbijom i Rumunijom. Ovo je uglavnom zbog većeg iskorišćenja kapitala i rasta zaposlenosti. Prosječan rast TFP-a takođe je bio visok u Srbiji (2,08), sa rastom proizvodnje od 3,02. U Crnoj Gori i Makedoniji, zemljama iz uzorka sa najnižim prosječnim godišnjim rastom BDP-a, prosječna stopa rasta TFP-a bila je negativna, dok su rast kapitala i rast iskorištenosti kapitala bili relativno visoki.

Dekompozicija rasta proizvodnje, ukupna ekonomija i sektorski pristup, (2000-2017)

PREZENTIRANI REZULTATI ISTRAŽIVANJA OBJAVLJENI SU U: BAĆOVIĆ, MAJA. (2021). TOTAL FACTOR PRODUCTIVITY GROWTH IN UPPER MIDDLE-INCOME BALKAN COUNTRIES FROM 2000-2017, TOTAL ECONOMY AND SECTORAL APPROACH: GROWTH ACCOUNTING METHOD, ARGUMENTA OECONOMICA. 1 (46), STR. 79-97.

		2000-2017

TFP u zemljama Balkana (2)

Ako uporedimo prosječne stope rasta TFP-a za ukupnu ekonomiju i na nivou sektora, vidimo da je rast TFP-a u industriji u najvećoj korelaciji sa ukupnim rastom TFP-a. Rast TFP-a u industriji bio je pozitivan u svim zemljama

U poljoprivredi, rast TFP-a bio je veći od ukupnog u Albaniji, Bugarskoj, Crnoj Gori, Srbiji i Rumuniji i bio je najvažniji faktor za rast dodane vrijednosti u poljoprivredi.

Rast TFP-a bio je najniži u sektoru usluga, čak negativan u četiri zemlje iz uzorka (Albanija, Bugarska, Sjeverna Makedonija i Crna Gora).

TFP u ekonomijama bivše SFRJ

Table 3. GDP growth and its determinants and unemployment rate, 1952–1987 and 1997–2019.

	Bosnia and Herzegovina	Montenegro	Croatia	Macedonia	Slovenia	Serbia

Fixed assets per person (const. 1972 prices, 000) ⁵						
1952–1987 ⁶	17.8	24.0	27.3	14.8	43.9	17.8
1997–2019 ⁷	6.1	18.0	38.8	11.0	71.4	10.7

¹Data from 2000–2019

²Data for Bosnia and Hercegovina are from 2007–2019, for Montenegro from 2000 to 2019

³Kukic (2020) also estimated TFP growth for the same sample from 1952 to 1986. Although different assumptions he applies resulted in slightly different annual rates, variation among republic (countries) is comparable with results in this research

⁴Data for Bosnia and Herzegovina are form 2007 to 2019, for Montenegrin from 2000 to 2019

⁵Similar values (average for 1953, 1963 and 1973) were estimated by Vinski (1959), 17,21

⁶1972 dinars

⁷2010 US\$

Objašnjenje dugoročnog privrednog rasta

- Hipoteza o konvergenciji – sto je zemlja dalje od svog stabilnog stanja, to će brže rasti
 - U Solovljevom modelu, u stabilnom stanju prosperitet je određen stopom stednje i stanjem tehnologije
 - Zemlje sa istim ili sličnim stopama stednje i uporedivim tehnologijama trebalo bi da na dugi rok ostvaruju isti dohodak per capita

$$\frac{\Delta Y_t}{Y_t} - \alpha = \beta \frac{\bar{Y}_t - Y_t}{\bar{Y}_t}$$

- $\frac{\Delta Y_t}{Y_t}$ - stopa rasta u periodu t
- α – stopa rasta u stabilnom stanju
- β – brzina konvergencije
- \bar{Y}_t - dohodak u stabilnom stanju

Objašnjenje dugoročnog privrednog rasta

- Uslovna konvergencija i nedostajući inputi
- Zemlje sa razlicitim proizvodnim funkcijama konvergirace ka razlicitim tackama stabilnog stanja
- Uzroci razlike u proizvodnim funkcijama:
 - Ljudski kapital
 - Infrastruktura
 - Društvena infrastruktura (svojinska prava, ljudska prava, politicka stabilnost)
- Mogućnost endogenog rasta
 - znanje

Politika privrednog rasta

- Obrazovanje i istraživanje
- Intelektualna svojina, patenti i politika konkurenčije
- Otvorenost razmjene i konkurenčija
- Politika, demokratija, jednakost i stabilnost
